New Books

TABLE OF CONTENTS

Manuals		Supplementary Textbooks	
Molecular Neuroscience A Laboratory Manual	A1	Human Variation: A Genetic Perspective on Diversity, Race, and Medicine	A17
Subcellular Fractionation A Laboratory Manual	A4	Navigating Metabolism	A18
		Quickstart Molecular Biology: An Introductory Course for Mathematicians, Physicists and Computational Scientists	A19
Handbooks		History/Biography	
A Bioinformatics Guide to Molecular Biologists	A5	Father to Son: Truth, Reason, and Decency	A20
Career Options for Biomedical Scientists	A6	Monographs	
Connecting with Companies A Guide to Consulting Agreements for Biomedical Scientists	A7	Biology of Heart Disease	A21
Experimental Design for Biologists Second Edition	A9	DNA Recombination	A23
Next Generation DNA Sequencing Informatics, Second Edition	A10	Endocytosis	A24
		Glia	A26
		Human Fungal Pathogens	A27
		Innate Immunity and Inflammation	A29
Symposia		Intellectual Property in Molecular Medicine	A30
Immunity & Tolerance <i>(Cold Spring Harbor Symposia on Quantitative Biology LXXVIII)</i>	A11	Microbial Evolution	A31
		Mitosis	A32
Advanced Textbooks		MYC and the Pathway to Cancer	A33
Epigenetics Second Edition	A13	Origin and Evolution of Eukaryotes	A35
Signal Transduction	A15	Retinal Disorders	A37
		Skin and Its Diseases	A39
		The Genetics and Biology of Sexual Conflict	A41
		Tuberculosis	A42

Molecular Neuroscience A Laboratory Manual

Edited by Rusty Lansford, *California Institute of Technology*

A wide variety of powerful molecular techniques have been applied to biology in recent decades, ranging from recombinant DNA technologies to state-of-the-art imaging methods. But the plethora of techniques available combined with the complexities of neurobiological systems can make it difficult for neuroscientists to select and carry out an experimental procedure to effectively address the question at hand.

This laboratory manual serves as a comprehensive practical guide to molecular and cellular methods for neuroscientists. It consists of five major sections: Working with Cells, Working with DNA, Working with RNA, Gene Transfer, and Imaging. Each includes step-by-step protocols and discussions of basic and cutting-edge procedures for working in that area. Fundamental techniques include maintaining a sterile working environment, purifying and culturing neural cells, isolating and manipulating DNA and RNA, and understanding and using a microscope. Advanced topics include single-neuron isolation and analysis, in vivo gene delivery and imaging, optogenetics, RNA interference, transgenic technologies, high-throughput analysis of gene expression (e.g., RNA-Seq), and constructing and imaging fluorescent proteins.

The manual includes protocols used in the Advanced Techniques in Molecular Neuroscience course offered annually at Cold Spring Harbor Laboratory, as well as protocols drawn from its best-selling lab manuals. It is an essential resource for all neuroscientists, from graduate students upward, who seek to use molecular techniques to probe the complexities of the nervous system.

CONTENTS

Foreword

Preface

SECTION 1. WORKING WITH CELLS

Working without Contamination

Kathy Barker

Sterile Pipetting and Pouring Techniques

Kathy Barker

Filter Sterilization Techniques

Kathy Barker

Aspirating Fluids with Sterile Technique

Kathy Barker

Working Sterilely in a Biosafety Cabinet

Kathy Barker

Mammalian Cell Culture

Gretchen J. Darlington

Purification and Culture of Retinal Ganglion Cells

Alissa Winzeler and Jack T. Wang

Purification and Culture of Retinal Ganglion Cells from Rodents

Alissa Winzeler and Jack T. Wang

Purification and Culture of Astrocytes

Lynette C. Foo

Purification of Rat and Mouse Astrocytes by Immunopanning

Lynette C. Foo

Maintaining Live Cells and Tissue Slices in the Imaging Setup

Michael E. Dailey, Glen S. Marris, and Dana Kurpius

SECTION 2. WORKING WITH DNA

BACTERIA BASICS

Bacteria

Kathy Barker

Making Media for Bacterial Culture

Kathy Barker

Obtaining Isolated Colonies of Bacteria

Kathy Barker

Using a Petroff-Hausser Counting Chamber

Kathy Barker

Measurement of Bacterial Growth by Spectrophotometry

Kathy Barker

Freezing Bacteria for Long-Term Storage

Kathy Barker

DNA BASICS

Preparation of Plasmid DNA by Alkaline Lysis with Sodium Dodecyl Sulfate: Miniprep

Joseph Sambrook and David W. Russell

Preparation and Transformation of Competent *E. coli* Using Calcium Chloride

Joseph Sambrook and David W. Russell

Quantitation of DNA and RNA

Carlos F. Barbas III, Dennis R. Burton,

Jamie K. Scott, and Gregg J. Silverman

The Basic Polymerase Chain Reaction

Joseph Sambrook and David W. Russell

Optimization and Troubleshooting in

Polymerase Chain Reaction

Kenneth H. Roux

A1

Molecular Neuroscience

A Laboratory Manual

continued

Working with Bacterial Artificial Chromosomes
Joseph Sambrook and David W. Russell

Isolation of Bacterial Artificial Chromosome DNA from Small-Scale Cultures
Joseph Sambrook and David W. Russell

Homologous Recombination Using Bacterial Artificial Chromosomes
Cary Lai, Tobias Fischer, and Elizabeth Munroe

Bacterial Artificial Chromosome Transgenic Mice and the GENSAT Database of Engineered Mouse Strains
Eric F. Schmidt, Laura Kus, Shiao-ching Gong, and Nathaniel Heintz

Agarose Gel Electrophoresis
Joseph Sambrook and David W. Russell

Southern Blotting: Capillary Transfer of DNA to Membranes
Joseph Sambrook and David W. Russell

Southern Hybridization of Radiolabeled Probes to Nucleic Acids Immobilized on Membranes
Joseph Sambrook and David W. Russell

PROTEIN-DNA INTERACTIONS

Electrophoretic Mobility-Shift Assays
Michael F. Carey, Craig L. Peterson, and Stephen T. Smale

Chromatin Immunoprecipitation (ChIP) Analysis of Protein-DNA Interactions
Tae Hoon Kim and Job Dekker

Formaldehyde Cross-Linking
Tae Hoon Kim and Job Dekker

Preparation of Cross-Linked Chromatin for ChIP
Tae Hoon Kim and Job Dekker

ChIP
Tae Hoon Kim and Job Dekker

ChIP-Quantitative Polymerase Chain Reaction (ChIP-qPCR)
Tae Hoon Kim and Job Dekker

ChIP-chip
Tae Hoon Kim and Job Dekker

ChIP-seq
Tae Hoon Kim and Job Dekker

SECTION 3. WORKING WITH RNA RNA BASICS

The Fundamentals of RNA Purification
Timothy W. Nilsen

General Procedures for Avoiding Contamination with RNase

Andras Nagy, Marina Gertsenstein, Kristina Vintersten, and Richard Behringer

Purification of RNA from Cells and Tissues by Acid Phenol-Guanidinium Thiocyanate-Chloroform Extraction

Joseph Sambrook and David W. Russell

Isolating Total RNA from Mouse Embryos or Fetal Tissues

Andras Nagy, Marina Gertsenstein, Kristina Vintersten, and Richard Behringer

Single-Neuron Isolation for RNA Analysis Using Pipette Capture and Laser Capture Microdissection

Ditte Lovatt, Thomas Bell, and James Eberwine

Antisense RNA Amplification for Target Assessment of Total mRNA from a Single Cell
Jacqueline Morris, Thomas J. Bell, Peter T. Buckley, and James H. Eberwine

Denaturation and Electrophoresis of RNA with Formaldehyde
Donald C. Rio

Northern Blots: Capillary Transfer of RNA from Agarose Gels and Filter Hybridization Using Standard Stringency Conditions
Donald C. Rio

Combinatorial Analysis of mRNA Expression Patterns in Mouse Embryos Using Hybridization Chain Reaction
David Huss, Harry M.T. Choi, Carol Readhead, Scott E. Fraser, Niles A. Pierce, and Rusty Lansford

Electrophoretic Mobility Shift Assays for RNA-Protein Complexes
Donald C. Rio

RNase Footprinting to Map Sites of RNA-Protein Interactions
Timothy W. Nilsen

Identification of RNA Cargoes by Antibody-Positioned RNA Amplification
Kevin Y. Miyashiro and James Eberwine

CLIP (Cross-Linking and Immunoprecipitation) Identification of RNAs Bound by a Specific Protein
Robert Darnell

TRANSCRIPTOME ANALYSIS

Transcriptome Analysis Using Microarrays

Preparation of Fluorescent-Dye-Labeled cDNA from RNA for Microarray Hybridization
Manuel Ares Jr.

Microarray Slide Hybridization Using Fluorescently Labeled cDNA

Manuel Ares Jr.

Scanning Microarray Slides
Manuel Ares Jr.

Tips on Hybridizing, Washing, and Scanning Affymetrix Microarrays
Manuel Ares Jr.

Methods for Processing Microarray Data
Manuel Ares Jr.

Transcriptome Analysis with High-Throughput Sequencing

Fragmentation of Whole-Transcriptome RNA Using *E. coli* RNase III
Manuel Ares Jr.

Preparation of Small RNA Libraries for High-Throughput Sequencing
Colin Malone, Julius Brennecke, Ben Czech, Alexei Aravin, and Gregory J. Hannon

Tips for Preparing mRNA-Seq Libraries from Poly(A)⁺ mRNA for Illumina Transcriptome High-Throughput Sequencing
Brenton R. Graveley

High-Throughput Illumina Strand-Specific RNA Sequencing Library Preparation
Silin Zhong, Je-Gun Joung, Yi Zheng, Yun-ru Chen, Bao Liu, Ying Shao, Jenny Z. Xiang, Zhangjun Fei, and James J. Giovannoni

Methods for Processing High-Throughput RNA Sequencing Data
Manuel Ares Jr.

RNAi

Creating an miR30-Based shRNA Vector
Kenneth Chang, Krista Marran, Amy Valentine, and Gregory J. Hannon

Packaging shRNA Retroviruses
Kenneth Chang, Krista Marran, Amy Valentine, and Gregory J. Hannon

Infection of Mammalian Cells with Retroviral shRNAs
Kenneth Chang, Krista Marran, Amy Valentine, and Gregory J. Hannon

Creating Transgenic shRNA Mice by Recombinase-Mediated Cassette Exchange
Prem K. Premvirut, Lukas E. Dow, Youngkyu Park, Gregory J. Hannon, and Scott W. Lowe

Molecular Neuroscience A Laboratory Manual

continued

SECTION 4. GENE TRANSFER

Nonviral Methods

DNA Transfection Mediated by Lipofection
Joseph Sambrook and David W. Russell

Transfection of Mammalian Cells with
Fluorescent Protein Fusions
David L. Spector and Robert D. Goldman

DNA Transfection by Electroporation
Joseph Sambrook and David W. Russell

PiggyBac Transposon-Mediated Cellular
Transgenesis in Mammalian Forebrain by In
Utero Electroporation
*Fuyi Chen, Brady J. Maher, and
Joseph J. LoTurco*

Single Cell/Cellular Subregion-Targeted
Phototransfection
Jaebee Lee, Jai-Yoon Sul, James H. Eberwine

VIRAL METHODS

Generation and Analysis of Lentivirus
Expressing a 2A Peptide-Linked Bicistronic
Fluorescent Construct
David Huss and Rusty Lansford

Lentiviral Vectors for Retrograde Delivery of
Recombinases and Transactivators
*Ian R. Wickersham, Heather A. Sullivan,
Gerald M. Pao, Hiroki Hamanaka,
Ki A. Goosens, Inder M. Verma,
and H. Sebastian Seung*

Rabies Viral Vectors for Monosynaptic Tracing
and Targeted Transgene Expression in Neurons
Ian R. Wickersham and Heather A. Sullivan

Concentration and Purification of Rabies Viral
and Lentiviral Vectors
Heather A. Sullivan and Ian R. Wickersham

Stable Producer Cell Lines for Adeno-
Associated Virus (AAV) Assembly
Gilliane Chadeuf and Anna Salvetti

Generation of Replication-Competent and -
Defective Herpes simplex Virus (HSV) Vectors
*William F. Goins, David M. Krisky, James B.
Wechuck, Darren Wolfe, Shaohua Huang, and
Joseph C. Glorioso*

Construction and Packaging of Herpes simplex

Virus/Adeno-Associated Virus (HSV/AAV)
Hybrid Amplicon Vectors
*Okay Saydam, Daniel L. Glauser, and
Cornel Fraefel*

SECTION 5. IMAGING MICROSCOPY BASICS

Microscopy
Kathy Barker

Using the Light Microscope
Kathy Barker

Confocal Microscopy: Principles and Practice
Alan Fine

Principles of Multiphoton-Excitation
Fluorescence Microscopy
Winfried Denk

Digital Scanned Laser Light Sheet Fluorescence
Microscopy
Philipp J. Keller and Ernst H. K. Stelzer

LIGHT MODULATION OF PROTEINS

Constructing and Expressing Fluorescent
Protein Fusions
David L. Spector and Robert D. Goldman

Imaging Green Fluorescent Protein-Labeled
Neurons Using Light and Electron Microscopy
Graham W. Knott

Imaging Synaptic Protein Dynamics Using
Photoactivatable Green Fluorescent Protein
*Robby M. Weimer, Travis C. Hill,
Andrew M. Hamilton, and Karen Zito*

Imaging Neuronal Activity with Genetically
Encoded Calcium Indicators
Lin Tian, S. Andrew Hires, and Loren L. Looger

Measuring Membrane Voltage with Fluorescent
Proteins
Jordan Patti and Ehud Y. Isacoff

Optogenetics: Opsins and Optical Interfaces in
Neuroscience
*Antoine R. Adamantidis, Feng Zhang,
Luis de Lecea, and Karl Deisseroth*

Establishing a Fiber-Optic-Based Optical
Neural Interface
*Antoine R. Adamantidis, Feng Zhang,
Luis de Lecea, and Karl Deisseroth*

IN VIVO IMAGING

Single-Cell Electroporation in *Xenopus*
Xue Feng Liu and Kurt Haas

Single-Cell Electroporation of *Xenopus* Tadpole
Tectal Neurons
Xue Feng Liu and Kurt Haas

In Vivo Time-Lapse Imaging of Neuronal
Development in *Xenopus*
*Edward S. Ruthazer, Anne Schohl, Neil
Schwartz, Aydin Tavakoli, Marc Tremblay, and
Hollis T. Cline*

Bulk Electroporation of Retinal Ganglion Cells
in Live *Xenopus* Tadpoles
*Edward S. Ruthazer, Anne Schohl, Neil
Schwartz, Aydin Tavakoli, Marc Tremblay, and
Hollis T. Cline*

4D Fluorescent Imaging of Embryonic Quail
Development
Christie A. Canaria and Rusty Lansford

Preparation and 4D Fluorescent Imaging of
Quail Embryos
Christie A. Canaria and Rusty Lansford

Generating and Imaging Multicolor Brainbow
Mice
*Tammy A. Weissman, Joshua R. Sanes,
Jeff W. Lichtman, and Jean Livet*

Two-Photon Imaging of Microglia in the
Mouse Cortex In Vivo
Axel Nimmerjahn

Mapping Anatomy to Behavior in Thy1:18
ChR2-YFP Transgenic Mice Using
Optogenetics
*Lief E. Fenno, Lisa A. Gunaydin,
and Karl Deisseroth*

Subcellular Fractionation

A Laboratory Manual

By Paul Pryor, *Hull York Medical School*

The successful isolation of specific cellular structures permits in-depth studies of their function and composition. This laboratory manual provides step-by-step protocols for the extraction of subcellular components from animal tissues, yeasts, plants, and cultured cells. Each chapter describes methods for isolating a particular organelle, vesicle, membrane, or macromolecular complex. Strategies for breaking cells without damaging the component of interest, enriching for that component based on its physical and biochemical characteristics, and monitoring and ensuring the success of the purification procedure are provided.

A Bioinformatics Guide for Molecular Biologists

Edited by Sarah Aerni, *Pivotal Software, Inc.*; Marina Sirota, *Systems Medicine, Stanford University*

Informatics can vastly assist progress in research and development in cell and molecular biology and biomedicine. However, many investigators are either unaware of the ways in which informatics can improve their research or find it inaccessible due to a feeling of “informatics anxiety.” This sense of apprehension results from improper communication of the principles behind these approaches and of the value of the many tools available. In fact, many researchers are inherently distrustful of these tools. A more complete understanding of bioinformatics offered in *A Bioinformatics Guide for Molecular Biologists* will allow the reader to become comfortable with these techniques, encouraging their use—thus helping to make sense of the vast accumulation of data. To make these concepts more accessible, the editors approach the field of bioinformatics from the viewpoint of a molecular biologist, (1) arming the biologist with a basic understanding of the fundamental concepts in the field, (2) presenting approaches for using the tools from the standpoint of the data for which they are created, and (3) showing how the field of informatics is quickly adapting to the advancements in biology and biomedical technologies. All concepts are paired with recommendations for the appropriate programming environment and tools best suited to solve the particular problem at hand. It is a must-read for those interested in learning informatics techniques required for successful research and development in the laboratory.

2014, 328 pp, illus. (64 4C, 26 B&W), index
Hardcover \$79 £50

Career Options for Biomedical Scientists

Edited by Kaaren Janssen, *Cold Spring Harbor Laboratory Press*; Richard Sever, *Cold Spring Harbor Laboratory Press*

The majority of PhDs trained in biomedical sciences do not remain in academia. They are now presented with a broad variety of career options, including science journalism, publishing, science policy, patent law, and many more. This book examines the numerous different careers that scientists leaving the bench can pursue, from the perspectives of individuals who have successfully made the transition. In each case, the book sets out what the job involves and describes the qualifications and skills sets required.

Connecting with Companies A Guide to Consulting Agreements for Biomedical Scientists

By Edward Klees, J.D., *General Counsel at the University of Virginia Investment Management Company*; H. Robert Horvitz, Ph.D., *2002 Nobel Laureate in Physiology or Medicine; Professor of Biology, MIT; Member, McGovern Institute for Brain Research, MIT; Member, Koch Institute for Integrative Cancer Research, MIT; Investigator, Howard Hughes Medical Institute*

An essential guide for academic scientists and physicians
who are considering consulting work in biomedicine

Before signing a consulting agreement, this must-have reference will help you understand the key issues to consider—from intellectual property, confidentiality, and compensation, to often overlooked issues such as indemnity, different classes of stock, and the relevance of insider trading and securities laws.

Read *Connecting with Companies* and you will:

- Gain invaluable, first-hand advice from the authors: a leading attorney and a Nobel Laureate in Physiology or Medicine, both with extensive experience reviewing and negotiating consulting agreements
- Receive guidance for academics, lawyers, accountants, auditors, venture capitalists, and technology transfer departments of universities, hospitals, and research organizations
- Understand crucial start-up issues such as 83b tax election and participating preferred stock

2014, 156 pp., glossary, index

Hardcover \$39 £24

ISBN 978-1-621821-07-6

Experimental Design for Biologists

Second Edition

By David J. Glass, *Novartis Institutes for Biomedical Research, Cambridge, Massachusetts*

The effective design and analysis of experiments in biology are critical to success, yet graduate students in biological and medical sciences typically receive very little formal training in these steps. With feedback from readers of the first edition, colleagues, and students taking the very popular experimental design courses taught by the author, this second edition of *Experimental Design for Biologists* retains the engaging writing style while organizing the book around the four elements of experimental design: the framework, the system, the experiment, and the model. The approach has been tested in the classroom, where the author has taught numerous graduate students, MD/PhD students, and postdoctoral fellows. The goal of every scientist is to discover something new and with the aid of *Experimental Design for Biologists*, this task is made a little easier.

This handbook explains how to establish the framework for an experimental project, how to set up all of the components of an experimental system, design experiments within that system, determine and use the correct set of controls, and formulate models to test the veracity and resiliency of the data. This thoroughly updated edition of *Experimental Design for Biologists* is an essential source of theory and practical guidance for designing a research plan

2014, 304 pp., illus. (34 B&W), index
Hardcover \$39 £24

ISBN 978-1-621820-41-3

CONTENTS

Preface

Section One: Philosophy of Experimentation

1. Why You Need to Read a Little Philosophy First: The Philosophy of Science Governs the Practice of Science
2. Defining Scientific Research
3. Why Do Science? What Is Science For? The Need for Inductive Reasoning
4. The First Step to Engaging in Scientific Research: Establishing Your Framework
5. A Short History of Philosophy Relevant to Scientific Method: How We Got to Where We Are Today and the Problem of Induction
6. The Sky Is Red Hypothesis: Examining the Hypothesis-Falsification Framework
7. The Hypothesis as a Framework for Scientific Projects: Is Critical Rationalism Critical Enough?
8. Scientific Settings in Which a Hypothesis-Falsification Framework Is Not Feasible
9. The Question and the Model: Forming an Inductive Framework for Scientific Projects (by Getting to Carnegie Hall)
10. Advantages to the Question/Model-Building Inductive Framework

11. A Biological Example of the Question/Model-Building Framework
12. Some Concluding Remarks on the Philosophy of Experimentation: Warnings and Exhortations

Section Two: System Validation

13. The System
14. System Validation
15. Choice of a Model Organism or Technique: Validation Experiments
16. System Validation Requirements for Distinct Experimental Readouts
17. System Specificity: Specificity of Detection and Specificity of Perturbation
18. System Sensitivity: Minimizing Signal to Noise to Improve Sensitivity of Detection
19. System Stability
20. Determining Conditions to Measure Efficacy
21. System Validation: Determining Conditions to Measure Safety

Section Three: The Experiment

22. Definition of the Experiment: The Framework for an Individual Experiment
23. The Negative Control: Distinct Types

24. The Requirement for the Positive Control
25. Method and Reagent Controls
26. Subject Controls
27. Assumption Controls
28. Experimentalist Controls: Establishing a Claim to an Objective Perspective
29. Biological Replicates, Technical Replicates, Experimental Repeats, Time Courses (Repeats over Time), and Dose Responses
30. Summary of the Components of the Individual Experiment

Section Four: The Model

31. Building the Model: Representations of the Experimental Data
32. Data Filtration
33. Model Induction: Asking Follow-Up Questions and Finishing the Project by Writing the Manuscript
34. A Short Synopsis

Section Five: Addendum

Designing the Experimental Project: A Biological Example

Next-Generation DNA Sequencing Informatics

Second Edition

Edited by Stuart M. Brown, *New York University School of Medicine*

Next-generation DNA sequencing (NGS) technology has revolutionized biomedical research, making genome and RNA sequencing an affordable and frequently used tool for a wide variety of research applications including variant (mutation) discovery, gene expression, transcription factor analysis, metagenomics, and epigenetics. Bioinformatics methods to support DNA sequencing have become and remain a critical bottleneck for many researchers and organizations wishing to make use of NGS technology. *Next-Generation DNA Sequencing Bioinformatics, Second edition*, provides thorough, plain language introduction to the necessary informatics methods and tools for analyzing NGS data as did the first edition, and provides detailed descriptions of algorithms, strengths and weaknesses of specific tools, pitfalls and alternative methods. Four new chapters in this edition cover: experimental design, sample preparation, and quality assessment of NGS data; Public databases for DNA Sequencing data; De novo transcript assembly; proteogenomics; and emerging sequencing technologies. The remaining chapters from the first edition have been updated with the latest information. This book also provides extensive reference to best-practice bioinformatics methods for NGS applications and tutorials for common workflows. The second edition of *Next-Generation DNA Sequencing Bioinformatics* addresses the informatics needs of students, laboratory scientists, and computing specialists who wish to take advantage of the explosion of research opportunities offered by new DNA sequencing technologies.

Immunity and Tolerance

(Cold Spring Harbor Symposia on Quantitative Biology LXXVIII)

Edited by Anne O'Garra, *MRC National Institute of Medical Research, London, UK*; Michel Nussenzweig, *HHMI/The Rockefeller University, New York*; Stephen Smale, *University of California, Los Angeles*; David Stewart, *Cold Spring Harbor Laboratory*; Bruce Stillman, *Cold Spring Harbor Laboratory*

The 78th Symposium covers many aspects of the immune system including the genetics, biochemistry, molecular and cell biology, and developmental biology of immune responses. Fundamental biological insights are described as well as new approaches intended to harness the immune system to treat disease, particularly cancer. The specific topics addressed in this volume include:

- Stem cells and cell fate decisions
- Regulation of immune cell development
- Antigen receptor gene assembly and modification
- Signal transduction
- Regulation of lymphocyte function
- Innate immune response and inflammation
- Adaptive immunity
- Mucosal immunity
- Organ specific immunity
- Immune regulation and tolerance
- Autoimmunity and allergy
- Immunity and cancer
- Pathogen-immune system interactions
- Vaccine development
- Novel strategies to engineer/harness immunity

2014, 304 pp, illus. (65 4C, 39 B&W), Index
 Hardcover \$318 £199
 Paperback \$129 £81

CONTENTS

Symposium Participants

Foreword

Development and Antigen Receptor Gene Assembly

TET Proteins and 5-Methylcytosine Oxidation in the Immune System
Ageliki Tsagaratou and Anjana Rao

Control of Antigen Receptor Diversity through Spatial Regulation of V(D)J Recombination
Anja Ebert, Jasna Medvedovic, Hiromi Tagoh, Tanja A. Schwickert, and Meinrad Busslinger

Establishment and Maintenance of B Cell Identity
Rudolf Grosschedl

Transcriptional Establishment of Cell-Type Identity: Dynamics and Causal Mechanisms of T-Cell Lineage Commitment
Ellen V. Rothenberg, Ameya Champhekar, Sagar Damle, Marissa Morales Del Real, Hao Yuan Kueh, Long Li, and Mary A. Yui

The Epigenetics of Early Lymphocyte Development
C. Murre

Gene Regulation

Regnase-1, a Ribonuclease Involved in the Regulation of Immune Responses
Shizuo Akira

Toward an Understanding of the Gene-Specific and Global Logic of Inducible Gene Transcription
Stephen T. Smale, Scott E. Plevy, Amy S. Weinmann, Liang Zhou, Vladimir R. Ramirez-Carrozzi, Scott D. Pope, Dev M. Bhatt, and Ann-Jay Tong

Tolerization of Inflammatory Gene Expression
John J. Seeley and Sankar Ghosh

The 'Histone Mimicry' by Pathogens
Uwe Schaefer, Jessica S.Y. Ho, Rab K. Prinjha, and Alexander Tarakhovskiy

Development and Function of Myeloid Subsets

Myb-Independent Macrophages: A Family of Cells That Develops with Their Tissue of Residence and Is Involved in Its Homeostasis
Elisa Gomez Perdiguero and Frederic Geissmann

Immunity and Tolerance

(Cold Spring Harbor Symposia on Quantitative Biology LXXVIII)

continued

The Molecular Choreography of IRF4 and IRF8 with Immune System Partners
Harinder Singh, Elke Glasmacher, Abraham B. Chang, and Bryan Vander Lugt

The IRF Family Transcription Factors at the Interface of Innate and Adaptive Immune Responses
Hiroaki Ikushima, Hideo Negishi, and Tadatsugu Taniguchi

T-Cell Differentiation and Function

IL-1 b Strikingly Enhances Antigen-Driven CD4 and CD8 T-Cell Responses
S.Z. Ben-Sasson, K. Wang, J. Cohen, and W.E. Paul

A Modified Model of T-Cell Differentiation Based on mTOR Activity and Metabolism
Jonathan D. Powell, Emily B. Heikamp, Kristen N. Pollizzi, and Adam T. Waickman

Novel Tools to Dissect the Dynamic Regulation of TCR Signaling by the Kinase Csk and the Phosphatase CD45
Ying Xim Tan, Julie Zikberman, and Arthur Weiss

NK Cells and Innate Lymphoid Cells

Dissection of Signaling in Inflammation: Three Novel Inflammatory Regulators
Thorsten Berger, Mary E. Saunders, and Tak W. Mak

Tissue-Resident Natural Killer Cells
Wayne M. Yokoyama, Dorothy K. Sojka, Hui Peng, and Zhigang Tian

Microbial Immunity

Immunology Taught by Human Genetics
Jean-Laurent Casanova, Laurent Abel, and Lluís Quintana-Murci

Systems Approach to Understand the Immune Response in Tuberculosis: An Iterative Process between Mouse Models and Human Disease
Anne O'Garra

The Zebrafish Guide to Tuberculosis Immunity and Treatment
Lalita Ramakrishnan

Microbiota: Host Interactions in Mucosal Homeostasis and Systemic Autoimmunity
Randy S. Longman, Yi Yang, Gretchen E. Diehl, Sangwon V. Kim, and Dan R. Littman

The Promised Land of Human Immunology
Laura F. Su, Arnold Han, Helen M. McGuire, David Furman, Evan W. Newell, and Mark M. Davis

Tolerance, TREGs and Inflammasome

Transcriptional Control of Regulatory T-Cell Differentiation
Joris van der Veecken, Aaron Arvey, and Alexander Rudensky

miR-181 and Metabolic Regulation in the Immune System
Adam Williams, Jorge Henao-Mejia, Christian C.D. Harman, and Richard A. Flavell

Encoding Immunological Memory in the Initiation of B-Cell Receptor Signaling
Susan K. Pierce and Wanli Liu

Tumor Immunology and Genome Stability

Programmed Cell Death 1-Directed Immunotherapy for Enhancing T-Cell Function
Koichi Araki, Ben Youngblood, and Rafi Ahmed

Immune Surveillance of Unhealthy Cells by Natural Killer Cells
Alexandre Iannello and David H. Raulet

Studying Epstein-Barr Virus Pathologies and Immune Surveillance by Reconstructing EBV Infection in Mice
Tomoharu Yasuda, Tristan Wirtz, Baochun Zhang, Thomas Wunderlich, Marc Schmidt-Supprian, Thomas Sommermann, and Klaus Rajewsky

Closing Lecture

Pathogen-Sensing, Regulatory T Cells, and Responsiveness-Tuning Collectively Regulate Foreign- and Self-Antigen Mediated T-Cell Responses
William E. Paul, Joshua D. Milner, and Zvi Grossman

Epigenetics

Second edition

Edited by C. David Allis, *The Rockefeller University, London*; Marie-Laure Caparros, *London*; Thomas Jenuwein, *Max-Planck Institute of Immunobiology and Epigenetics*; Danny Reinberg, *Howard Hughes Medical Institute, New York University School of Medicine-Smilow Research Center*; Associate Editor Monika Lachlan, *Max-Planck Institute of Immunobiology and Epigenetics*

An understanding of epigenetics is central to research in transcriptional regulation, development, and disease. The second edition of the best-selling *Epigenetics* textbook builds on the strong foundation of the first edition, expanding from 24 to 36 expertly written chapters. Revised chapters from the first edition cover the basic molecular mechanisms underpinning epigenetic regulation, discussing many cellular processes that rely on this kind of regulation, and survey the studies carried out in the whole spectrum of model organisms in which it has been most examined.

New to the book is the inclusion of the expanding structural data on the machinery that modifies histones and DNA, giving weight and understanding to the molecular workings of chromatin and epigenetics. Also new is the inclusion of studies showing how chromatin remodeling machinery, and the higher order 3-D organization of the nucleus, are contributing to epigenetic regulation. A chapter is dedicated to the mounting evidence in mouse models of transgenerational epigenetic inheritance. Findings from studies of development, reprogramming, and disease highlight not only the importance of epigenetics but also the potential for epigenetic therapy, as illustrated in chapters covering the immune and neuronal systems, and cancer.

This book is a major resource for those working in the field, as well as a suitable text for advanced undergraduate and graduate courses on gene regulation.

Signal Transduction

Edited by Lewis Cantley, *Harvard Medical School*; Tony Hunter, *The Salk Institute*,
Richard Sever, *Cold Spring Harbor Laboratory*; Jeremy Thorner, *University of
California, Berkeley*

Cells must respond to a wide variety of signals. These include hormones, growth factors, morphogens, and environmental stress, as well as signals from internal regulators and checkpoints. A complex network of signal transduction pathways within the cell ensures that these signals are relayed to the correct molecular targets and that the cell responds appropriately.

This textbook provides a comprehensive view of signal transduction, covering both the fundamental mechanisms involved and their roles in key biological processes. Taking a novel approach, it first lays out the basic principles of signal transduction, explaining how different receptors receive information and transmit it via signaling proteins, ions, and second messengers. It then surveys the major signaling pathways that operate in cells, before examining in detail how these function in processes such as cell growth and division, cell movement, metabolism, development, reproduction, the nervous system, and immune function.

The book is essential reading for students learning about signal transduction for the first time. It will also be a vital reference for all cell, molecular, and developmental biologists and pharmacologists, neurobiologists, and immunologists studying processes regulated by cell signaling.

Human Variation

A Genetic Perspective on Diversity, Race, and Medicine

Edited by Aravinda Chakravarti, *Johns Hopkins University School of Medicine, Institute of Genetic Medicine*

Since the appearance of modern humans in Africa around 200,000 years ago, we have migrated around the globe and accumulated genetic variations that affect various traits, including our appearance, skin color, food tolerance, and susceptibility to different diseases. Large-scale DNA sequencing is now allowing us to map the patterns of human genetic variation more accurately than ever before, trace our ancestries, and develop personalized therapies for particular diseases. It is also reinforcing the idea that human populations are far from homogeneous, are highly intermixed, and do not fall into distinct races or castes that can be defined genetically.

This book provides a state-of-the-art view of human genetic variation and what we can infer from it, surveying the genetic diversity seen in Africa, Europe, the Americas, and India. The contributors discuss what this can tell us about human history and how it can be used to improve human health. They also caution against assumptions that differences between individuals always stem from our DNA, stressing the importance of nongenetic forces and pointing out the limits of our knowledge. The book is thus essential reading for all human geneticists and anyone interested in how we differ and what this means.

Navigating Metabolism

By Navdeep Chandel, *Northwestern Medical School, Department of Medicine/Division of Pulmonary & Critical Care Medicine*

Metabolic pathways used to be ‘road maps’ most biologists learnt as undergraduates and then promptly forgot. Recent work has revealed how changes in metabolism are closely linked to many aspects of cell behavior and the development of cancer and other diseases. This book represents both a new look at metabolism and a refresher course. It surveys the major metabolic pathways, places these in biological context, and highlights the key control points that control cell behavior and can become dysregulated in disease.

Quickstart Molecular Biology

An Introductory Course for Mathematicians, Physicists, and Engineers

By Philip N. Benfey, *Duke Center for Systems Biology*

As biology becomes more quantitative and computational, increasing numbers of physical scientists, mathematicians, and engineers are moving into areas such as genomics, developmental biology, neuroscience, and systems biology. The science of molecular biology underpins all these subjects, and an understanding of its fundamental concepts and the key experimental techniques used is essential.

This book provides an introductory course in molecular biology that is designed specifically for mathematicians, physicists, and computational scientists. It starts by introducing the basic features of DNA, genes, proteins, and cells, before moving on to organismal development, genetic traits, and human evolution. In each case, basic concepts are described in the context of recent technological advances, such as next-generation sequencing, mass spectrometry, and high-throughput screens. The book thus enables readers to move rapidly from the basics of molecular biology to an understanding of cutting-edge techniques used in cell and developmental biology, genomics, and synthetic biology.

Father to Son

Truth, Reason, and Decency

By James D. Watson, *Cold Spring Harbor Laboratory*

At the age of 24, James Watson had a scientific discovery to his credit—the structure of DNA—that would win a Nobel Prize and forever change our understanding of genes and inheritance. Now, after a lifetime of accomplishment in research, writing, education, and science advocacy, Watson has delved for the first time publicly into his own lineage to chronicle an archetypical American family from before the Civil War to Vietnam. With its portraits of many memorable characters, illustrated with previously unpublished photographs and period documents, *Father To Son* brilliantly illuminates the fundamental truth that who we become as individuals is determined by both our genetic and cultural heritage.

Biology of Heart Disease

Edited by Kenneth R. Chien, *Massachusetts General Hospital*; Margaret Buckingham, *Institut Pasteur*; Christine L. Mummery, *Leiden University Medical Center*

The heart is the first organ to form in a developing embryo, and all subsequent life processes depend on its proper function. But a range of genetic and environmental factors can lead to its failure. Inherited mutations give rise to congenital heart disease, the most common birth defect, and abnormalities of the adult heart are a leading cause of illness and death in industrialized countries.

Written and edited by experts in the field, this collection from *Cold Spring Harbor Perspectives in Medicine* describes how recent advances in genetics, stem cell biology, and developmental biology are transforming the way we understand and treat heart disease. Contributors review the various cell lineages and molecular networks involved in heart development; the genetic basis of inherited cardiac conditions such as congenital heart disease, cardiomyopathies, and aortic aneurysm; and how various cutting-edge technologies and models are being employed to study heart biology, uncover disease-related processes, and identify therapeutic targets. Topics include tissue engineering, genome editing, stem cells, cardiomyocyte reprogramming, chemically modified RNA, and next-generation DNA sequencing.

The authors also consider the process of drug discovery and development, and the potential for patient-specific treatments and therapies. This volume is a valuable reference for cardiologists, geneticists, and cell and developmental biologists interested in this complex, vital organ and the future of cardiovascular medicine.

DNA Recombination

Edited by Stephen Kowalczykowski, PhD, *University of California, Davis*; Neil Hunter, PhD, *University of California, Davis*; Wolf-Dietrich Heyer, PhD, *University of California, Davis*

Recombination mechanisms allow cells to break and reattach DNA sequences. They are important for repair of damaged DNA. They also help generate additional genetic diversity in sperm and eggs cells by mixing DNA sequences from maternal and paternal chromosomes. This volume explores the molecular details of recombination and their roles in genome maintenance and meiosis.

Due January 2015, 350 pp. (approx.), index
Hardcover \$135 £85

CONTENTS (preliminary)

1. Overview of RM
Stephen Kowalczykowski
- 1.1. Sources of DNA Double-Strand Breaks and Models of Recombinational DNA Repair
Anuja Mehta and James E. Haber
- 1.2. End Resection at DNA Double-Strand Breaks: Mechanism and Regulation
Lorraine S. Symington
- 1.3. DNA Pairing and Annealing: Processes in Homologous Recombination and Homology-Directed Repair
Scott W. Morrical
- 1.4. Mediators of Homologous DNA Pairing
Alex Zelensky, Roland Kanaar, and Claire Wyman
- 1.5. Regulation of DNA pairing in Homologous Recombination
James M. Daley, William A. Gaines, YoungHo Kwon, and Patrick Sung
- 1.6. The Dissolution of Double Holliday Junctions
Anna H. Bizard and Ian D. Hickson
- 1.7. Holliday Junction Resolvases
Haley D.M. Wyatt and Stephen C. West
- 1.8. Structural Studies of DNA End Detection and Resection in Homologous Recombination
Christian Bernd Schiller, Florian Ulrich Seifert, Christian Linke-Winnebeck, and Karl-Peter Hopfner
2. Regulation of recombination
Wolf-Dietrich Heyer
- 2.1. Cell cycle and DDR-mediated regulation homologous recombination
John Petrini
- 2.2. Histone modifications & chromatin remodelling
Alain Nicolas
- 2.3. Cell Biology of Mitotic Recombination
Michael Lisby and Rodney Rothstein
- 2.4. Transcription and Recombination: When RNA Meets DNA
Andrés Aguilera and H el ene Gaillard
- 2.5. Replication and Recombination
Aisha H. Syeda, Michelle Hawkins, and Peter McGlynn
- 2.6. Mismatch Repair During Homologous and Homeologous Recombination
Maria Spies and Richard Fishel
- 2.7. The Role of DSB Repair Pathways at Functional and Dysfunctional Telomeres
Ylli Doksan and Titia de Lange
- 2.8. Gross chromosomal rearrangements...
Richard Kolodner
- 2.9. Mechanisms of Gene Duplication and Amplification
Andrew B. Reams and John R. Roth
- 2.10. Recombinational DNA Repair and Human Disease: BRCA1, BRCA2, and Associated Proteins
Robit Prakash, Yu Zhang, Weiran Feng, and Maria Jasin
3. Meiotic recombination—Overview
Neil Hunter
- 3.1. Recombination, Pairing, and Synapsis of Homologs During Meiosis
Denise Zickler and Nancy Kleckner
- 3.2. Mechanism and Regulation of Meiotic Recombination Initiation
Isabel Lam and Scott Keeney
- 3.3. DNA Strand Exchange and RecA Homologs in Meiosis
M. Scott Brown and Douglas K. Bishop
- 3.4. Control of crossover formation
Michael Lichten
- 3.5. The Meiotic Checkpoint Network: Step-by-Step Through Meiotic Prophase
Vijayalakshmi V. Subramanian and Andreas Hochwagen
- 3.6. Human Aneuploidy, Infertility, and the Maternal Age Effect
Mary Herbert, Dimitrios

Endocytosis

Edited by Sandra L. Schmid, *University of Texas Southwestern Medical Center; University of Pittsburgh School of Medicine*; Marino Zerial, *Max Planck Institute of Molecular and Cell Biology*

During endocytosis, extracellular molecules and plasma membrane components are selectively internalized by cells. This fundamental process of “cellular ingestion” is required for diverse activities such as nutrient uptake, cell adhesion and migration, signal transduction, cytokinesis, neurotransmission, and antigen presentation. Pathogens (e.g., HIV) exploit endocytic pathways to gain entry into cells, and defects in the endocytic machinery can lead to diseases such as cancer.

Written and edited by experts in the field, this collection from *Cold Spring Harbor Perspectives in Biology* covers all of the major pathways of endocytosis and post-endocytic trafficking, and how they regulate cellular and organismal physiology. Contributors describe how cargo enters the cell via clathrin-mediated and clathrin-independent pathways, including caveolar endocytosis, micropinocytosis, cholesterol-sensitive endocytosis, phagocytosis, and the CLIC/GEEC pathway. They review the numerous machineries (e.g., Rab GTPases, tethering factors, and retromer) that transport cargo through endosomes and deliver it to lysosomes or recycle it back to the cell surface, and the signals and mechanisms governing these sorting decisions. Topics such as lysosomal dynamics, the biophysical challenges of bending membranes, and the evolution of endocytic systems are also covered.

This volume also includes substantial discussion of the roles of endocytic trafficking in organismal development, physiology, and disease. It is thus an indispensable reference for cell biologists, but also neuroscientists, immunologists, developmental biologists, microbiologists, and others concerned with the physiological and therapeutic implications of this key cellular process.

CONTENTS

Endocytosis: Past, Present, and Future

Sandra L. Schmid, Alexander Sorkin, and Marino Zerial

Molecular Structure, Function and Dynamics of Clathrin-Mediated Membrane Traffic

Tom Kirchhausen, David Owen, and Stephen C. Harrison

Endocytic Accessory Factors and Regulation of CME

Christien Merrifield and Marko Kaksonen

Cargo Recognition in Clathrin-Mediated Endocytosis

Linton M. Traub and Juan S. Bonifacino

Imaging and Modeling the Dynamics of Clathrin-Mediated Endocytosis

Marcel Mettlen and Gaudenz Danuser

Clathrin-Independent Pathways of Endocytosis

Satyajit Mayor, Robert G. Parton, and Julie G. Donaldson

The Complex Ultrastructure of the Endo-Lysosomal System

Judith Klumperman and Graça Raposo

Rab Proteins and the Compartmentalization of the Endosomal System
Angela Wandinger-Ness and Marino Zerial

Retromer: A Master Conductor of Endosome Sorting
Christopher Burd and Peter J. Cullen

Lipid Sorting and Multivesicular Endosome Biogenesis
Christin Bissig and Jean Gruenberg

Molecular Mechanisms of the Membrane Sculpting ESCRT Pathway
William Mike Henne, Harald Stenmark, and Scott D. Emr

Ubiquitin-Dependent Sorting in Endocytosis
Robert C. Piper, Ivan Dikic, and Gergely Lukacs

The Biogenesis of Lysosomes and Lysosome-Related Organelles
J. Paul Luzio, Yvonne Hackmann, Nele M.G. Dieckmann, and Gillian M. Griffiths

Bending “On the Rocks”—A Cocktail of Biophysical Modules to Build Endocytic Pathways
Ludger Johannes, Christian Wunder, and Patricia Bassereau

Glia

Edited by Ben A. Barres, *Stanford University School of Medicine*; Marc R. Freeman, *Howard Hughes Medical Institute, University of Massachusetts Medical School*; Beth Stevens, *Boston Children's Hospital, Harvard University*

Glia are cells that serve to nourish and support the neuronal cells that relay electrical signals through the nervous system. They also play critical roles in development and synapse formation, helping to establish neural circuits. This book examines our understanding of the basic biology of glia and their roles in diseases such as Alzheimer's and cancer. What emerges from this work is new insight into the importance of glial cells, especially an appreciation that the development, function, and malfunction of our brains can only be understood as a signaling interplay between neurons and glial cells.

Human Fungal Pathogens

Edited by Arturo Casadevall, *Albert Einstein College of Medicine of Yeshiva University*; Aaron P. Mitchell, *Carnegie Mellon University*; Judith Berman, *Tel Aviv University*; Kyung J. Kwon-Chung, *National Institute of Allergy and Infectious Diseases*; John R. Perfect, *Duke University Mycology Research Unit*; Joseph Heitman, *Duke University Medical Center*

Some yeasts and molds that are common in the environment can infect humans and cause a range of diseases, from superficial (e.g., athlete's foot) to severe (e.g., cryptococcal meningitis). These pathogenic fungi pose a particular threat to immunocompromised individuals, such as those living with HIV/AIDS, and are becoming a leading cause of morbidity and mortality worldwide.

Written and edited by experts in the field, this collection from *Cold Spring Harbor Perspectives in Medicine* provides a comprehensive review of the biology and diseases of fungal pathogens. Contributors examine their life cycles, nutritional and metabolic requirements, and morphological characteristics, as well as their interactions with humans—their modes of dissemination and penetration, the mechanisms they use to evade the immune system, and their effects on target organs. Specific chapters are devoted to the major disease-causing fungi, such as *Candida*, *Aspergillus*, and *Cryptococcus* species. The ecology, evolution, and epidemiology of human fungal pathogens are also explored.

This volume includes discussions about options for diagnosing and treating fungal infections, as well as challenges presented by emerging drug-resistant strains. It is therefore an essential reference for all fungal biologists and medical professionals who wish to understand and manage these difficult pathogens.

Due December 2014, 350 pp. (approx.), illus., index
Hardcover \$135 £85

ISBN 978-1-621820-75-8

CONTENTS

Introduction and General Principles and Evolution of Fungal Pathogens

1. The Spectrum of Fungi that Infect Humans
Julia R. Köhler, Arturo Casadevall, and John Perfect

Innate Immunity & Inflammation

Edited by Ruslan Medzhitov, *Yale University School of Medicine*

The innate immune system is rapidly activated in response to infection and injury. It is a generic rather than pathogen-specific response that recruits immune cells, promotes inflammation, and mobilizes the adaptive immune system. Excessive or chronic inflammation may cause tissue damage, so a careful balance is required to restore homeostasis.

Written and edited by experts in the field, this collection from *Cold Spring Harbor Perspectives in Biology* reviews the cellular and molecular mechanisms involved in innate immunity and all types of inflammation. The contributors examine the cell types that make up the innate immune system, their use of pattern recognition receptors (e.g., Toll-like receptors) to identify pathogens and damaged tissues, and how they trigger signaling pathways that culminate in inflammation, pathogen destruction, and tissue repair. The numerous chemical signals and factors involved in innate immunity and inflammation are described, as are those that keep inflammation in check.

The authors also discuss the diseases that can result when these processes go awry, such as rheumatoid arthritis and cancer. This volume is therefore a valuable reference for all immunologists, cell biologists, and medical scientists wishing to understand these protective processes and their implications for human health and disease.

Intellectual Property in Molecular Medicine

Edited by Salim Mamajiwalla, *In(sci)te IP Inc.*; Rochelle Seide, *RKS Consulting*

As universities increasingly spin off biotech companies and academics work more closely with these companies and the pharma industry, it is essential that they gain an understanding of intellectual property law and patenting. This book introduces the basic ideas and discusses how they apply to biomedical research and product development in the age of genomics.

Due January 2015, 350 pp. (approx.), illus., index
Hardcover \$135 £85

ISBN 978-1-621820-83-3

CONTENTS (preliminary)

1. Introduction to Intellectual Property: A US Perspective
Amanda Murphy, Michael Stramiello, Tom Irving, and Stacy Lewis
2. Impact of America Invents Act on Biotech Intellectual Property
Amanda Murphy, Michael Stramiello, Tom Irving, and Stacy Lewis
3. Patenting the Life Sciences at the European Patent Office
Christina Gates
4. The Role of Regulatory Agencies and Intellectual Property
Kevin Noonan
5. Regulatory Law and Intellectual Property in Europe
Anne Bateman
6. Canada's Patented Medicines (Notice of Compliance) Proceedings and Intellectual Property
Henry Bian and Conor McCourt
7. Inventorship and Authorship
Antoinette F. Koski
8. Must an Inventor "Possess" an Invention to Patent It?
Warren D. Woessner and Robin A. Chadwick
9. Obviousness Determinations in Pharma & Biotech Intellectual Property
Daniel Pereira and Stephen G. Kunin
10. Inherent Anticipation in Pharma and Biotech
Michael Goldman, Georgia Evans, and Andrew Zappia

Microbial Evolution

Edited by Howard Ochman, *University of Texas*

Bacteria are ancient organisms that represent most life on Earth. They evolve extremely rapidly, often exchanging genetic material through a process termed lateral DNA transfer. Consequently it's often unclear how to define individual species and phylogenetic trees. This book examines our understanding of bacterial evolution. Focusing on how genomics is revolutionizing our approach to studying these organisms.

Topics include:

- Epidemiological genetics
- Evolution of new functions de novo and from pre-existing genes
- How microbial genes evolve
- Mutation—the Engine of Evolution: Studying Mutation and Its Role in the Evolution of Bacteria
- Paleobiological Perspectives on Early Microbial Evolution
- The Evolution of *Campylobacter jejuni* and *Campylobacter coli*
- Co-Evolution of the Organization and Structure of Prokaryotic Genomes

Due December 2014, 300 pp. (approx.), illus., index
Hardcover \$135 £84

ISBN 978-1-621820-37-6

Mitosis

Edited by Jonathan Pines, *Wellcome/Cancer Research UK Gurdon Institute*; Anthony Hyman, *Max Planck Institute of Molecular Cell Biology and Genetics*; Mitsuhiro Yanagida, *Okinawa Institute of Science and Technology Promotion Corporation*

Mitosis—division of a cell to produce two daughter cells—is a complicated process that must be highly coordinated to ensure events such as chromosome separation take place at the right time and in the right order. This book provides a state-of-the-art examination of the mechanics of mitosis, how the process is regulated, and the different checkpoints and quality-control steps involved.

Due February 2015, 400 pp. (approx.), illus., index
Hardcover \$135 £84

MYC and the Pathway to Cancer

Edited by Chi V. Dang, *University of Pennsylvania*; Robert N. Eisenman, *Fred Hutchinson Cancer Research Center*

The *MYC* gene family plays essential roles in normal development and in multiple cellular functions. Moreover aberrant *MYC* gene activation is profoundly involved in the etiology of a wide range of cancers. *MYC* encodes a transcriptional regulator that modulates expression of genes controlling cell growth, proliferation, metabolism, differentiation, and death. Deregulation of these expression programs has been linked to *MYC*'s function in tumor initiation, progression, and survival.

Written and edited by experts in the field, this collection from *Cold Spring Harbor Perspectives in Medicine* covers all aspects of *MYC* biology. The contributors discuss its normal functions in the control of cell growth, cell competition, pluripotency, and development, as well as the molecular basis for the effects of the *MYC* protein on transcription. In addition, they examine how *MYC* interacts with other proteins, induces apoptosis, and impacts metabolism, genomic stability, and microRNA expression.

The authors also provide a detailed analysis of the role of *MYC* in tumor initiation and progression. Its involvement in cancers such as medulloblastoma, neuroblastoma, and Burkitt's lymphoma is examined, as are the prospects for anti-*MYC* therapies in cancer treatment. This book is essential reading for all cancer biologists, as well as researchers studying the regulation of gene expression.

Origin and Evolution of Eukaryotes

Edited by Patrick J. Keeling, *Canadian Institute for Advanced Research, Botany Department University of British Columbia* and Eugene V. Koonin, *Senior Investigator, NCBI, NLM, NIH*

All protists, fungi, animals, and plants on Earth are eukaryotes. Their cells possess membrane-bound organelles including a nucleus and mitochondria, distinct cytoskeletal features, and a unique chromosome structure that permits them to undergo mitosis or meiosis. The emergence of eukaryotic cells from prokaryotic ancestors about 2 billion years ago was a pivotal evolutionary transition in the history of life on Earth. But the change was abrupt, and few clues exist as to the nature of the intermediate stages.

Written and edited by experts in the field, this collection from *Cold Spring Harbor Perspectives in Biology* examines evolutionary scenarios that likely led to the emergence and rapid evolution of eukaryotes. Contributors review the mechanisms, timing, and consequences of endosymbiosis, as well as molecular and biochemical characteristics of archaea and bacteria that may have contributed to the first eukaryotic lineage. They explore all of the available evidence, including clues from the fossil record and comparative genomics, and formulate ideas about the origin of genomic characteristics (e.g., chromatin and introns) and specific cellular features (e.g., the endomembrane system) in eukaryotes. Topics such as the origins of multicellularity and sex are also covered.

This volume includes discussion of multiple evolutionary models that warrant serious attention, as well as lively debate on some of the most contentious topics in the field. It will thus be fascinating reading for evolutionary biologists, cell and molecular biologists, paleobiologists, and all who are interested in the history of life on Earth.

CONTENTS

Preface

How Natural a Kind is "Eukaryote"?
W. Ford Doolittle

The Impact of History on Our Perception of Evolutionary Events: Endosymbiosis and the Origin of Eukaryotic Complexity
Patrick J. Keeling

Symbiosis as a General Principle in Eukaryotic Evolution
Angela E. Douglas

The Neomuran Revolution and Phagotrophic Origin of Eukaryotes in the Light of Intracellular Coevolution and a Revised Tree of Life
Thomas Cavalier-Smith

Bioenergetic Constraints on the Evolution of Complex Life
Nick Lane

The Archaeal Legacy of Eukaryotes: A Phylogenomic Perspective
Lionel Guy, Jimmy H. Saw, and Thijs J. G. Ettema

The Dispersed Archaeal Eukaryome and the Complex Archaeal Ancestor of Eukaryotes
Eugene V. Koonin and Natalya Yutin

How and When Was the Mitochondrion Acquired?
Anthony M. Poole and Simonetta Gribaldo

What Was the Real Contribution of Endosymbionts to the Eukaryotic Nucleus? Insights from Photosynthetic Eukaryotes
David Moreira and Philippe Deschamps

Paleobiological Perspectives on Early Eukaryotic Evolution
Andrew H. Knoll

On the Age of Eukaryotes: Evaluating Evidence from Fossils and Molecular Clocks
Laure Emé, Susan C. Sharpe, Matthew W. Brown, and Andrew J. Roger

The Eukaryotic Tree of Life from a Global Phylogenomic Perspective
Fabien Burki

Origin and Evolution of the Self-Organizing Cytoskeleton in the Network of Eukaryotic Organelles
Gáspár Jékely

Missing Pieces of an Ancient Puzzle: Evolution of the Eukaryotic Membrane-Trafficking System

Alexander Schlacht, Emily K. Herman, Mary J. Klute, Mark C. Field, and Joel B. Dacks

Protein Targeting and Transport as a Necessary Consequence of Increased Cellular Complexity
Maik S. Sommer and Enrico Schleiff

Retinal Disorders Genetic Approaches to Diagnosis and Treatment

Edited by Richard Masland, *Harvard Medical School, Massachusetts Eye and Ear Infirmary*,
Joan Miller, *Massachusetts Eye and Ear Infirmary*, Eric Pierce, *Massachusetts Eye and
Ear Infirmary*

Retinal disorders are a leading cause of blindness. This book examines the molecular basis of these diseases, focusing on genetic approaches that are improving both our understanding of the disease process and their diagnosis, as well as advances in gene therapy that have been used to cure patients and provide a model for treatment of other conditions.

Due December 2014, 400 pp. (approx.), index
Hardcover \$135 £85

ISBN 978-1-621820-17-8

CONTENTS (preliminary)

A. Genetics of Inherited Retinal Degenerations

1. Clinical characteristics and current therapies for inherited retinal degenerations
Jose Sahel, Katia Marzova, and Isabelle Audo
2. The current status of disease gene discovery: inherited retinal degenerations macular dystrophies and clinical genetic testing
Steve Daiger
3. Genomic approaches for the discovery of inherited retinal degeneration genes
Frans Cremers
4. Genetic modifiers, and oligogenic inheritance
Nico Katsanis
5. Gene expression/transcriptomes for enhancing inherited retinal degeneration genetics
Mike Farkas
6. Stem cells as tools for studying the genetics of inherited retinal degenerations
Budd Tucker

B. Genetics of AMD

7. Clinical characteristics and current treatment of AMD
Yoshihiro Yonekawa and Ivana Kim
8. Genome-wide association studies: getting to pathogenesis, the role of inflammation/complement in AMD
Jonathan Haines and Jessica Cooke Bailey

9. Components of drusen
John Crabb

10. Highly penetrant alleles
Anneke den Hollander and Eiko de Jong

11. Differential gene expression in AMD
Margaret DeAngelis

12. Clinical applications of AMD genetics
Emily Chew and John Paul SanGiovanni

C. Glaucoma

13. Clinical characteristics and current treatment of glaucoma
Lou Pasquale and Laura Cohen

14. Common and rare genetic risk factors for glaucoma
Janey Wiggs

15. Differential gene expression in glaucoma
Tatjana Jakobs

16. Inflammation in glaucoma
Gareth Howell and Ileana Soto Reyes

17. Clinical applications of genetics for glaucoma and optic neuropathy.
Janey Wiggs

D. Gene/Genetic Therapies for Inherited Retinal Disorders

A. Gene therapy trials

18. The status of RPE65 gene therapy trials: efficacy and long-term safety.
Jean Bennett

19. Gene therapy for choroideremia-AAV
Rob MacLaren and Alun Barnard

20. Gene therapy for retinal degeneration due to mutations in ABCA4
Rando Allikmets

21. Gene therapy for the retinal degeneration of Usher Syndrome due to mutations in MYO7A
David Williams

22. Genetic testing and genetic discovery of retinal degenerations genes
Rob Koenekoop and Naveen Mysore

23. Anti-VEGF gene therapy
Sam Wadsworth, Peter Pechan, and Abraham Scaria

B. Gene Therapies in Pre-Clinical Studies

24. Gene therapy for achromatopsia
Mathias Seeliger, Martin Biel, Regine Muehlfriedel, Mayouki Tanimot, Stylianos Michalakis

25. Leber congenital amaurosis due to mutations in GUCY2D
Shannon Boye

26. Gene therapy for retinoschisis
Paul Sieving, Lisa Wie, and Ronald Bush

27. Retinitis pigmentosa due to mutations in PRPH2-nanoparticles
Muna Naash and Shannon Conley

28. Leber congenital amaurosis due to mutations in RPEGIP1
Tiansen Li

Skin and Its Diseases

Edited by Anthony Oro, *Professor, Dermatology, Stanford University School of Medicine, Department of Dermatology / Oro Lab* and Fiona Watt, *Director, Centre for Stem Cells and Regenerative Medicine, King's College London*

The skin is the largest organ in the human body, and it is constantly bombarded with external stimuli. It offers protection and insulation, prevents dehydration, and senses the environment. But irritants, infections, and inherited genetic mutations cause hundreds of skin disorders, ranging from mild cosmetic conditions to serious diseases such as cancer.

Written and edited by experts in the field, this collection from *Cold Spring Harbor Perspectives in Medicine* provides a comprehensive review of the biology of the skin, its numerous functions, and the diseases that affect it. Contributors discuss the various components of the epidermis, dermis, hair follicles, glands, and nerve endings that make up the skin, the molecular pathways and processes that underlie their development and function, and what happens when these processes go awry. The important functions of skin stem cell populations in tissue development, homeostasis, and repair are described, as are the roles of resident and recruited cells in inflammatory responses. Several chapters are devoted to cutaneous disorders, including alopecias, carcinomas, melanomas, psoriasis, and genetic diseases such as epidermolysis bullosa.

Topics such as age-related changes to the skin, the roles of resident microbes in skin health and disease, and advances in therapies for cutaneous disorders are also covered. This volume is therefore a vital reference for dermatologists, cancer biologists, cell and developmental biologists, immunologists, and all who seek to understand the numerous functions and diseases of this major organ.

The Genetics and Biology of Sexual Conflict

Edited by William Rice, *University of California, Santa Barbara*; Sergey Gavrilets, *National Institute for Mathematical and Biological Synthesis*

The genetic interests of males and females often diverge; traits favored by one sex can be costly to the other. Over time, this “battle of the sexes,” or sexual conflict, has important evolutionary consequences (e.g., speciation).

Written and edited by experts in the field, this collection from *Cold Spring Harbor Perspectives in Biology* examines the underlying biology of sexual conflict—from the molecular to the behavioral levels—and its role as an important driver of evolution. Contributors review multiple examples of sexual antagonism (e.g., parental care and mating rate), its genetic basis, the various and sometimes dramatic ways that it is manifested (e.g., infanticide and copulatory wounding), and its evolutionary impacts, especially on male–female coevolution and reproductive isolation. Topics such as hermaphroditism and homosexuality are also covered.

This volume includes discussion of the evolutionary origins of sexual conflict and its relationship to other evolutionary forces (e.g., sexual selection). It will thus be fascinating reading for all geneticists and biologists who are interested in the evolution of sexual reproduction.

CONTENTS

Preface

Foreword

The Sexual Cascade and the Rise of Pre-Ejaculatory (Darwinian) Sexual Selection, Sex Roles, and Sexual Conflict
Geoff A. Parker

The Relationship between Sexual Selection and Sexual Conflict

Hanna Kokko and Michael D. Jennions

Specialists and Generalists: The Sexual Ecology of the Genome

David Haig, Francisco Úbeda, and Manus M. Patten

Sexual Conflict and Seminal Fluid Proteins: A Dynamic Landscape of Sexual Interactions
Laura K. Sirot, Alex Wong, Tracey Chapman, and Mariana F. Wolfner

Paradox of Mother's Curse and the Maternally Provisioned Offspring Microbiome

Michael J. Wade

The Evolution of Sexually Antagonistic Phenotypes

Jennifer C. Perry and Locke Rowe

Sexual Conflict, Life Span, and Aging

Margo I. Adler and Russell Bonduriansky

Copulatory Wounding and Traumatic Insemination

Klaus Reinhardt, Nils Antbes, and Rolanda Lange

Sexual Conflict Arising from Extrapair Matings in Birds

Alexis S. Chaine, Robert Montgomerie, and Bruce E. Lyon

Sexually Antagonistic Zygotic Drive: A New Form of Genetic Conflict between the Sex Chromosomes

Urban Friberg and William R. Rice

Sex Chromosome Drive

Quentin Helleu, Pierre R. Gérard, and Catherine Montchamp-Moreau

Sex-Biased Gene Expression and Sexual Conflict throughout Development

Fiona C. Ingleby, Ilona Flis, and Edward H. Morrow

Infanticide as Sexual Conflict: Coevolution of Male Strategies and Female Counterstrategies

Ryne A. Palombit

Human Homosexuality: A Paradigmatic Arena for Sexually Antagonistic Selection?

Andrea Camperio Ciani, Umberto Battaglia, and Giovanni Zanzotto

Sexual Conflict between Parents: Offspring Desertion and Asymmetrical Parental Care

Tamás Székely

Sexual Conflict in Hermaphrodites

Lukas Schärer, Tim Janicke, and Steven A. Ramm

Patterns and Mechanisms of Evolutionary Transitions between Genetic Sex-Determining Systems

G. Sander van Doorn

Reproductive Parasitism: Maternally Inherited Symbionts in a Biparental World

Gregory D.D. Hurst and Crystal L. Frost

Sexual Conflict and Sperm Competition

Dominic A. Edward, Paula Stockley, and David J. Hosken

Conflict on the Sex Chromosomes: Cause, Effect, and Complexity

Judith E. Mank, David J. Hosken, and Nina Wedell

Is Sexual Conflict an “Engine of Speciation”?

Sergey Gavrilets

Sexual Cannibalism as a Manifestation of Sexual Conflict

Jutta M. Schneider

Mechanisms and Evidence of Genital Coevolution: The Roles of Natural Selection, Mate Choice, and Sexual Conflict

Tuberculosis

Edited by Stefan H.E. Kaufmann, *Max Planck Institute for Infection Biology*, Eric Rubin, *Harvard School of Public Health*; Ali Zumla, *University College London Medical School*

Tuberculosis (TB) is a serious infectious disease of the lungs that is usually caused by the bacterium *Mycobacterium tuberculosis*. Nearly one-third of the world's population is currently infected with latent TB, and millions of individuals develop the active, potentially fatal form of the disease each year. The continuing emergence and spread of drug-resistant TB strains is one of the most difficult challenges facing control of the disease.

Written and edited by experts in the field, this collection from *Cold Spring Harbor Perspectives in Medicine* examines all aspects of *M. tuberculosis* biology, transmission, and infection, as well as ongoing strategies to treat and control it. Contributors explore the biological characteristics of *M. tuberculosis*, its complex interactions with the human immune system, and factors that influence the progression from latent to active TB disease (e.g., coinfection with HIV/AIDS). The clinical manifestations of TB, both pulmonary and extrapulmonary, are fully described and illustrated.

This volume also includes discussions of recent advances in the development of diagnostics, drugs, and vaccines, as well as strategies for enhanced implementation of existing interventions. It is an essential reference for microbiologists, immunologists, pathologists, epidemiologists, and clinicians, and all who wish to understand and combat this global health burden.

Due November 2014, 664 pp., illus. (52 4C, 71 B&W), index
Hardcover \$135 £85

ISBN 978-1-621820-73-4

CONTENTS

Section 1. Vaccines, Immunology, Host Cells, and Biomarkers

1. Cell-Autonomous Effector Mechanisms Against *Mycobacterium tuberculosis*
John D. MacMicking
2. Manipulation of the Mononuclear Phagocyte System by *Mycobacterium tuberculosis*
Geanncarlo Lugo-Villarino and Olivier Neyrolles
3. Interaction of *Mycobacterium tuberculosis* with Host Cell Death Pathways
Lalitha Srinivasan, Sarah Ahlbrand, and Volker Briken
4. Autophagy in Tuberculosis
Vojo Deretic
5. Innate and Adaptive Cellular Immune Responses to *Mycobacterium tuberculosis* Infection
Katrin D. Mayer-Barber and Daniel L. Barber

6. Antigen for CD4 and CD8 T Cells in Tuberculosis
Cecilia S. Lindstrom Arlehamn, David Lewinsohn, Alessandro Sette, and Deborah Lewinsohn
7. Non-Classical T Cells and Their Antigens in Tuberculosis
Gennaro De Libero, Amit Singhai, Marco Lepore, and Lucia Mori
8. Role of B Cells and Antibodies in the Acquired Immunity against *Mycobacterium tuberculosis*
Jacqueline M. Achkar, John Chan, and Arturo Casadevall
9. Immunity and Immunopathology in the Tuberculous Granuloma
Antonio J. Pagán and Lalita Ramakrishnan
10. Novel Vaccination Strategies Against Tuberculosis
Peter Andersen and Stefan H.E. Kaufmann
11. Toward a Unified Biosignature for Tuberculosis
Jeroen Maertzdorf, Stefan H.E. Kaufmann, and January Weiner III

12. Clinical Immunology and Multiplex Biomarkers of Human Tuberculosis
Gerhard Walzl, Mariëlle C. Haks, Simone A. Joosten, Léanie Kleyhans, Katharina Ronacher, and Tom H.M. Ottenhoff
13. Mouse Model of Tuberculosis
Andrea M. Cooper
14. Animal Models of Tuberculosis: Guinea Pigs
Simon Clark, Yper Hall, and Ann Williams
15. Animal Models of Tuberculosis: Zebrafish
Lisanne M. van Leeuwen, Astrid M. van der Sar, and Wilbert Bitter
16. Modeling Tuberculosis in Non-Human Primates
Charles A. Scanga and JoAnne L. Flynn

Section 2. Drugs and Biology of Tuberculosis

17. Mycobacterial Growth
Iria Ubia, Kerstin J. Williams, Vahid Shahrezaei, and Brian D. Robertson
